

For Immediate Release

New Marelon[®] Engine Flush Out Valves Engine Seacocks with Direct Flush Out Connection

Rancho Santa Margarita, CA - Forespar has introduced two new 3-way engine Seacock valves that incorporate flush out or winterizing capabilities directly onto the cooling system. Regular fresh water flushing is known to extend engine life and with the new Engine Flush Out Valve, boat owner's can quickly and easily flush their engine without changing hoses or using pumps.

Two versions of Forespar[®] Flush Out Valves are available. One incorporates a standard female garden hose connection directly into the top of the valve, while the other uses a hose barb connection that leads to a deck fill connection plate. Each utilizes a 3-way valve lever that can be switched from engine cooling, flush out or off depending on current need.

Constructed of Forespar's non-corrosive and ultra lightweight Marelon[®] material, the Engine Flush-out Valves will not deteriorate in the harsh marine environment like standard bronze seacocks. They can be quickly installed to any inboard motor cooling system using existing thru-hulls and are both Marine U.L. approved and A.B.Y.C. compliant for above and below the waterline. The hose version attaches to a standard garden hose while the barbed version is available to accommodate 1", 1-1/4", 1 1/2" or 2" hose dimensions.

Forespar[®] is one of the oldest boat hardware manufacturers in the United States. Their diverse line of marine products includes carbon fiber poles, Leisure Furl[™] boom furling systems, Marelon[®] plumbing fittings and numerous other marine related products.
