

WL-1 Floating LED Strobe Light #205102

(12/21/2016)

The Forespar[®] WL-1 Man-Overboard LED strobe light is a floating marker light to be deployed to mark the location where a person or object has fallen overboard. The advanced high intensity LED light is stored in the stainless steel mounting bracket (included) in an inverted position and ready for instant use. Upon being thrown overboard it automatically begins to flash when it floats in an upright position.

The high intensity LED strobe flash is visible for several miles from the air as well as from 360° of horizon. The great advantage of an LED strobe is its remarkably greater brilliance, which can penetrate rain, fog and haze. This brilliance does not decrease with battery drain unlike an incandescent light. Instead, the flash frequency diminishes slowly as the battery nears the end of its capacity. When used with a fresh <u>alkaline</u> type battery, you may expect the U.S. Coast Guard required flash rate of 50 to 70 flashes per minute to continue for more than 1,000 hours.

Uses only 6-volt Alkaline spring post style lantern battery.

The body and lens of the WL-1 water light are molded of high impact resistant plastic, which offers high U.V. resistance and zero corrosion. Your WL-1 LED water light can be expected to provide service for years to come with the following simple care and handling instructions:

Battery Installation

Manufacturers of water marker lights, including Forespar[®], ship these lights without batteries. To install battery:

- 1. Hold with strobe down and be sure the circuit board is fully seated in the black frame holder with the circuit contact area facing upward.
- 2. Seat 6volt Alkaline lantern battery with spring/coil terminals in remaining half of case/housing.
- 3. Invert the battery inside case/housing over circuit board and rotate half of case holding battery until threaded. **HAND TIGHT ONLY.**

Care And Use

Do not clean the case or lens with solvents or petroleum distillates. Use only soap and fresh water or, if necessary, rubbing alcohol. Be sure to attach the light to your horseshoe or ring buoy with a 5-foot lanyard made of floating line such as polypropylene. **Use only a 6-volt; spring post style lantern battery** (Alkaline preferably). Batteries should be readily available at local hardware or camping supplies stores. Forespar[®] does <u>not</u> carry batteries.
